AUTHOR: Borisenok, I. T.

TITLE: Control system with redundancies

SOURCE: Moscow. Universitet. Vestnik. Seriya 1. Matematika, mekhanika, no. 2, 1964, 83-96

TOPIC TAGS: control system, redundancy, reliability, nondamping steady-state oscillation, follower system, defective redundant element, gyroscopic platform, control channel, stability, synchronous motion

ABSTRACT: For guaranteeing high reliability in certain control systems, redundancy is used. In such control systems there may arise nondamping steady-state oscillations of rather high amplitude. It is also interesting to study oscillations of systems with defective redundant elements. The author investigates oscillations and the conditions under which they arise in control systems with properly operating and faulty redundant elements. He considers the cases where the characteristics of the redundant elements are linear and nonlinear. Under certain condi-

Card 1/3

ACCESSION NR: AP4026421

tions on the coefficients, a linear control system with properly operating redundant elements may attain periodic motion, and the motion of the elements of control becomes synchronous in the course of time. If the rudder is deviated to the opposite side, the oscillation amplitude increases. A nonlinear control system with properly operating redundant elements may have periodic motion under a certain condition, and the small values of the zone of insensitivity of the characteristics of the redundant elements have little effect on the size of instability of the amplitude of the steady-state oscillations. The region of stability of a control system with defective redundant elements decreases in comparison to the region of stability of a control system with properly operating elements. The introduction of control by a derivative with the help of a transmitter of angular velocities of a differentiating correcting contour of prediction makes it possible to decrease considerably the amplitude of steady-state oscillations. In a nonlinear control system, the amplitude of the steady-state oscillations of the object decreases as the number of broken reverse relations of the redundant elements increases. "In conclusion I use this opportunity to express my gratitude to V. I. Belyakov who did part of the computations for the examples." Orig. art. has: 4 tables and 69 formulas.

TITLE: Control system with cold reserving

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kibernetika, no. 6, 1965, 19-22

TOPIC TAGS: automatic control, automatic control system, automatic control theory

ABSTRACT: A control system having both hot and cold reserve units and describable by linear or nonlinear differential equations is considered. When a break occurs in the feedback loop of one of the hot-reserve elements, the system is brought into an unstable uncontrollable state. It is suggested that distorted-signal functions be used in such a case for determining the failure and for connecting cold-reserve units in order to restore normal operation of the system. A set of linear equations that can describe the above system was studied on an analog computer; corresponding phase portraits are presented. Orig. art. has: 10 figures and 3 formulas.

TITLE: Quantitative Spectrographic Determination of Gallium in Silicates, Ores and Minerals (Kolichestvennoye opredeleniye galliya v silikatnykh porodakh i mineralakh spektral'nym metodom).

PERIODICAL: Zhurnal Analiticheskoy Khimii, 1957, Vol. 12, Nr 6, pp. 704-707 (USSR).

ABSTRACT: The quantitative spectrographic determination of gallium in various silicates, ores and minerals by applying sodium chloride as "buffer" with series of standard mixtures is described. Sodium vapor decreases the volatilization temperature and eliminates the influence of other elements during volatilization. The sensitiveness for the determination of gallium is increased by this, up to  $1.10^{-4}\%$ , viz. ten times. The determination of gallium was carried out by means of the spectroscopic apparatus MCII-22 by using a gap of 0,005 mm. Spectrally pure carbon was used for the electrodes. The most sensitive gallium line 2943,64 Å was used and the lead line 3034,1 Å was employed as a comparison line. The error with gallium-quantities higher than 0,001 % amounts to 3 % and with gallium-concentrations less than 0,001 to 8 %.

There are 5 figures, 1 table, and 11 references, 8 of which are Slavic.

TITLE: The Distribution of Gallium in the Rocks of the Soviet Union  
(Raspredeleniye galliya v gornykh porodakh Sovetskogo Soyuza)

PERIODICAL: Geokhimiya, 1959, Nr 1, pp 46-59 (USSR)

ABSTRACT: The article lists the results obtained by 1500 analyses of different rocks and most important rock-forming minerals of the Soviet Union. Gallium was determined by means of a spectrum analysis; the method was developed by the author (Ref 24) and checked by fluorometric (Ref 25) and colorimetric (Ref 26) analyses. The test samples for the spectrum analysis were checked by the international standard G-1, the accuracy being 10%. Aluminum and silicon were determined spectrographically by diluting the materials in zinc oxide (1:100); checks were made by wet chemical analyses of some samples. The analyses are classed according to the rock chemism: ultra-basic rocks with an average of 0.0002% Ga (Tables 1 and 2), basic rocks with 0.0015% Ga (Tables 3 and 4), intermediate rocks with 0.0016% Ga (Tables 5 and 6), acid rocks with 0.0019% Ga (Tables 7 and 8), and alkali rocks with 0.0040% Ga (Tables 9 and 10). Table 11 contains a summary organized

Card 1/2

The Distribution of Gallium in the Rocks of the Soviet Union SOV/7-59-1-6/14

according to the locations of deposits. Summarizingly one may say: The Ga content increases from the ultra-basic towards the acid rocks, while the Al content is approximately proportional (Fig 1). A more detailed investigation shows, however, that the Ga -Al - ratio increases as the  $\text{Al}_2\text{O}_3$  content decreases, i.e. it increases in the direction towards acid rocks (Fig 2). A concentration of Ga in the remaining melt proves the relatively high Ga-content of the pegmatites (Table 12). Generally speaking, the distribution shows no great variations and is independent of area, age, and formation conditions. Certain unimportant regional concentrations are due to alkali rocks, alkali pegmatites, metasomatism, or the formation of greisen. There are 2 figures, 12 tables, and 29 references, 13 of which are Soviet.

TITLE: Geochemistry of Gallium in the Granitoids of the Susamyr Batholith (Central Tyan'-Shan') (Geokhimiya galliya v grani-toidakh Susamyrskogo batolita (Tsentrал'nyy Tyan'-Shan'))

PERIODICAL: Geokhimiya, 1959, Nr 2, pp 145-151 (USSR)

ABSTRACT: From a geochemical and crystallochemical point of view, gallium is closely bound to aluminum in the magmatic phase; about 60-70% of gallium replace aluminum of feldspar, which contains from 12 to 25 g/t Ga. Other gallium concentrators are hornblende (18 g/t) and especially biotite (45-70 g/t). The distribution of Ga in the individual intrusion phases of the Susamyr batholith (Table 2) shows only insignificant variations. The average Ga content is 0.0017%. Only in granite aplites an enrichment up to 0.0022% takes place. The close geochemical connection between gallium and aluminum manifests itself in the unchanging Ga/Al ratio in rocks with varying silicic acid content in the same magmatic complex. According to a diagram of Ga/Al versus  $\text{SiO}_2$ , this ratio remains virtually constant in the Susamyr batholith at a value of  $0.8 \cdot 10^{-4}$ . There are 1 figure, 2 tables and 2 Soviet references.

TITLE: Gallium in the Rocks of the Lovozero Alkaline Massif (Galliy  
v porodakh Lovozerskogo shchelochnogo massiva)

PERIODICAL: Geokhimiya, 1959, Nr 5, pp 449 - 454 (USSR)

ABSTRACT: Gallium was determined by the extraction with rhodamine B without previous separation of the other elements (method according to reference 4). The results are given in a large table (Table 1), arranged according to the four intrusion phases of the massif. Furthermore, the results of the spectroscopic gallium determination and the aluminum content are given. The aluminum determinations were carried out by Yu. B. Kholina. The Ga- and Al-values are given in a diagram as well. Another table (Table 2) gives the gallium content of individual minerals. The gallium contents fluctuate between 3 and  $10 \cdot 10^{-3}\%$ ,  $6 \cdot 10^{-3}\%$  is the average for the whole massif. This is more than the usual content of the nepheline syenites. The third intrusion phase has the highest gallium content. Gallium is enriched in the later phases, compared to aluminum. Gallium

TITLE: Gallium in the Alkali Rocks of the Massif Sandyk (Northern Kirgiziya)

PERIODICAL: Geokhimiya, 1959, Nr 6, pp 505 - 512 (USSR)

ABSTRACT: Altogether 50 rock specimens and 11 minerals from these rocks were investigated. The method has been developed by L. A. Borisenok (Ref 4). Table 1 shows the gallium content of the rock-forming minerals from three syenites. Table 2 gives the average contents of the individual types of rock and their surface in %. The average Ga-content of the massif is  $19.3 \cdot 10^{-4}$  %, the average Ga/Al-ratio is  $1.9 \cdot 10^{-4}$ , fluctuates, however, between 1.2 and  $2.3 \cdot 10^{-4}$ . In the course of differentiation the Ga-content rises parallel with the Al-content, whereas the  $\text{Fe}^{+3}$ -content decreases (Fig). The distribution of Ga in the minerals depends on the course of precipitation. The 6-coordination is in this case apparently preferred to the 4-coordination. Amounting to  $30.6 \cdot 10^{-4}$  the gallium content of the vein rocks is higher than that of the mother rock (Table 3). The authors thank L. V. Tauson for his

TITLE: The geochemical cycle of gallium

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1961, 127, abstract 24G18 (Sb. "Geokhim. tsikly", M., Gosgeoltekhnizdat, 1960, 41 - 51)

TEXT: The gallium concentration has been determined in 1500 specimens of different rocks and minerals by spectral analysis. Percentage Ga content and the  $\text{Ga:Al} \cdot 10^{-4}$  ratio (in brackets) are: meteorites 0.0003, ultrabasic 0.0002 (1.0), basic 0.0015 (1.8) medium 0.0016 (1.9), acid 0.0019 (2.6), alkaline 0.004 (4.1). In ultrabasic rocks Ga is concentrated pyroxenes and hornblende. In basic, medium, and acid rocks Ga is concentrated in feldspars, but sometimes an increased concentration is found in muscovite, biotite etc. In alkaline rocks it occurs in nepheline and feldspar. A high Ga-concentration is found in sodalite and cancrinite. It is noted that the same amount of Ga is found both in source rocks and rocks of the principal crystallization stage. The slight Ga-enrichment of rocks of the

vein series throws doubt on Goldschmidt's conclusion regarding the accumulation of Ga in residual magmas. In hydrothermal veins Ga concentrates in sphalerites (up to 30%), more in low than in high-temperature ones. In sedimentary rocks the average Ga concentration is 0.0015% in clays it is up to 0.005%, and in sands up to 0.001%. Ga accumulates in alkaline waters (less in marine, than in continental facies) and may even be used as an indicator; in oceanic waters Ga amounts to  $5 \cdot 10^{-8}\%$ . Abstract : Accessory sacroiliac joints were found; in 27 (16.4%) of 165 cases studied; they were bilateral in 19 cases. Accessory articular surfaces in the sacrum were located most often at the level of the two upper posterior sacral foramina and in the ilium - near the upper posterior spine; variations of the joint locations were described. The shape of the accessory joints' surfaces was quite variable. The transverse and longitudinal diameters varied from 3 mm. to 24 mm. The plane of the accessory joint did not correspond to the sagittal (plane) but formed an angle with the plane of the main

Investigation of the Constant of Electrolytic Dissociation of  
Allyl-o-toluidine Thiocyanate in Water-Alcohol Solutions  
(Issledovaniye konstanty elektroliticheskoy dissotsiatsii  
rodanistovodorodnogo allilortotoluidina v vodnospirtovykh  
rastvoritelyakh)

PERIODICAL: Zhurnal fizicheskoy khimii, 1959, Vol 33, Nr 4, pp 840-843  
(USSR)ABSTRACT: One of the authors synthesized a number of allyl thiocyanates  
(Refs 1, 2) which proved to be bactericidal and hypotensive  
substances. Since these substances are electrolytes it may be  
assumed that their above-mentioned properties are due to the  
ions into which they decompose. For this reason the dissociation  
constant (DC) of allyl aniline thiocyanate was determined al-  
ready in various nonaqueous solvents (Ref 3). In the present  
case the (DC) of allyl-o-toluidine-thiocyanate (I) was de-  
termined in water (W), water-alcohol mixtures (WA) and absolute  
ethanol (E). These measurements are of importance also because  
the quantitative determinations of the allyl aminothiocyanates  
take place colorimetrically in (WA). The (DC) was measured  
according to the method of electrical conductivity and determin-

Card 1/2

SOV/76-33-4-14/32  
Investigation of the Constant of Electrolytic Dissociation of Allyl-o-toluidine Thiocyanate in Water-Alcohol Solutions

ed by means of a normal Kohlrausch-bridge. The measurement results of the specific electrical conductivity of (I) in (W) (Table 1), in 50% (A) (Table 2), 90% (A) (Table 3), and absolute (A) (Table 4), show that the (DC) of (I) decreases with dilution of (A) (Table 5) i.e. the (DC) of (I) is inversely proportional to the (DC) of the medium. This deviation from the Nernst-Tomson rule (Ref 7) is explained by the formation of a new chemical compound between the dissolved substance and the solvent which rarely occurs in (WA) and which requires further investigations. There are 5 tables and 6 references, 7 of which are Soviet.

TITLE: Principles of designing legends for geomorphological maps. The generalization problem

SOURCE: AN SSSR. Otdeleniye nauk o Zemle. Geomorfologicheskaya komissiya. Metodika geomorfologicheskogo kartirovaniya (Methods of geomorphological mapping). Moscow, Izd-vo Nauka, 1965, 19-27

TOPIC TAGS: cartography, geomorphology, tectonics

ABSTRACT: The author discusses legends for geomorphological maps and stresses the need for standardization on the national level. Until recently, geomorphologic cartography has mainly been based on the so-called "morphogenetic" principle. Such maps show only those relief features which have common origin and history. The new mode of mapping (Borisevich, 1950) depicts surfaces of different ages, origins or geomorphological quality. The distinction between the older morphogenetic and the new morphochronogenetic modes of presentation has become evident in the preparation of maps for engineering purposes. Through a judicious use of symbols and colors, it is possible to convey the required information without crowding the map with symbols. The method is

Card 1/2

ACC NR: AT6022490

applicable to both small scale maps (e. g., 1:500,000) as well as to the large scale maps. Generalization of data for presentation on the small scale maps is accomplished either by omitting minor details or combining them into groups. Generalization of exogenous forms of relief, which are identical but vary in age, involves showing form complexes instead of individual forms, e. g., terrace complexes instead of individual terraces. Generalization of exogenous forms, which are of the same age and of similar genesis should be done with a view to clarity, e. g., streams should be grouped as permanent or intermittent. Generalization of features, which are different in age and origin, is the most difficult and should be avoided if possible. The generalization of elements of geotectonic formations is accomplished by means of contours of red color. The generalization of re-built elements of relief involves black cross-hatching superimposed onto the color symbols. The author obtained good results when he applied this technique to cartographic work in the Caucasus.

AUTHOR: Borisevich, N.A.; Gruzinskiy, V.V.; Tolkachev, V.A.

TITLE: Concerning anti-Stokes fluorescence of molecules

SOURCE: Optika i spektroskopiya, v.16, no.1, 1964, 171-174

TOPIC TAGS: molecular fluorescence, anti-Stokes fluorescence, fluorescence excitation, vapor fluorescence, solution fluorescence, fluorescence spectrum, absorption spectrum, 3,6-tetramethyldiaminophthalimide, 3-aminophthalimide

ABSTRACT: It has been demonstrated in some recent papers (I.Ketskemety,J.Dombi and R.Horvai,Acta Phys.Hung.12,No.263,1960; Ann.Phys.8,342,1961; M.N.Alevantsev and L.A. Pakhomycheva,Opt.i spektr.12,565,1962; Yu.T.Mazurenko,Ibid.13,854,1962) that the decrease in the quantum efficiency of fluorescence of solutions under anti-Stokes excitation is connected with inactive absorption. In the present work it is shown, however, that in the case of thoroughly purified substances no decrease of the fluorescence efficiency of vapors and solutions occurs in the anti-Stokes region. The investigated substances were 3,6-tetramethyldiaminophthalimide and 3-aminophthalimide, which have been investigated earlier (B.S.Neporent and N.A.Borisevich,Opt.i

Card 1/2

ACC.NR: AP4011506

spektr.1,114,1956; DAN SSSR,94,447,1954; Yu.T.Mazurenko.Ibid.13,854,1962). They were synthesized and then thoroughly purified by repeated recrystallization and sublimation under vacuum at different temperatures. Adequate measures were taken to avoid contamination of any kind. The solution absorption spectra were recorded by means of an SF-4 spectrophotometer; the absorption of the vapors by means of a set-up assembled about an SF-4 spectrophotometer. The fluorescence spectra were measured by means of a high sensitivity photoelectric set-up. The absorption and fluorescence spectra in the approximate range from 18 000 to 26 000  $\text{cm}^{-1}$  are reproduced in figures. In all cases the excitation function  $F_\lambda$  is linear. It is inferred that the "apparent" anti-Stokes decrease in fluorescence efficiency reported by other authors was connected with the presence of impurities that affected the weak absorption of the host in this spectral region. The authors are grateful to T.E.Kolosova for synthesis and purification of the investigated substances." Orig.art.has: 2 figures

TITLE: The Electric Viscosimeter EVI -53 (Elektroviskozimetr EVI -53)

PERIODICAL: Priborostroyeniye, 1958, Nr 4, pp. 17-18 (USSR)  
Received by CIA: 1962

ABSTRACT: The work performed by means of this apparatus consists in transforming the amount of viscosity into the phase shift of an auxiliary voltage which is proportional to it and to measure this shift.  
In principle the wiring diagram is as follows: The coilings of a micromotor are switched on to the feed lines of the system. The coilings of the microgenerator are connected by means of a compensation bridge with a subtracting potentiometer. A phase indicator is built into the diagonal of the bridge; its rectified voltage with respect to amount and sign depends upon the phase shift between the voltages  $U_d$  - grid voltage at the rectifier triodes - and  $U_1$ ,  $U_2$  - anode voltages.  
This device offers the following advantages:

Title : Effect of surrounding medium and supply of oscillation energy of molecules on continuous spectra of organ. compounds

Periodical : Izv. AN SSSR. Ser. fiz. 18/6, 674-675, Nov-Dec 1954

Abstract : Investigation was conducted to determine the changes in spectra caused by the addition of a foreign gas or vapor to the vapors of the substance investigated. The molecules of 3-animophthalimide and 3,6-tetramethyl-diaminophthalimide were analyzed to establish the effect of the oscillation energy supply on the form of their spectra. Results showed that the addition of foreign matter effect only the position of the electron levels of the molecules. The intermolecular reactions causing displacement of the levels are determined by dispersion forces. Three USSR references (1951 and 1953). Table; graph.

The yield of fluorescence of the vapors and solutions of substituted phthalimides, H. A. Boitevich, V. V. Zelin  
94-27-0 1954 The yield of fluorescence of the vapors and  
of compounds containing nitrogen and a carbonyl group,  
including phthalimides, III. The yields  
of fluorescence of the vapors and of  
the liquid phase were measured. Then, by means  
of the method of successive dilutions,  
the absorption coefficient was determined.  
It was found that a narrow spectral region  
known as fluorescence is also present in the spectrum of fluorescer  
substances. The absorption coefficient was  
calculated from the absorption spectra of the  
vapors and of the liquid phase. The absorption  
coefficient of the vapor phase is not  
constant, as in the case of III. In this case, This  
is due to the fact that the absorption profile  
of the vapor phase is not centered on the central  
maximum of the absorption spectrum. The quantum yield  
of fluorescence of the vapors and of the  
solutions is lower than the yield of fluorescence of the  
solid specimens. For I which has no carbonyl group in the  
spectra, the yield for vapor is lower than for solution.

The fluorescence of vapor chains was  
but the extinction coefficient was  
lower value than that of the  
vapor of intermediate  
order by close values of the  
dissociation of vapor. So the  
disappearance of vapor  
rate is larger than  
that of the vapor of  
the first order.  
- The absorption of vapor  
of the second order  
tobacco smoke gave the  
same. The absorption  
of the vapor of  
the first order

5118. INVESTIGATION OF ANTI-STOKES FLUORESCENCE OF THE VAPOURS OF AROMATIC COMPOUNDS. B.S.Nurotov and N.A.Borisovich

Dokl Akad. Nauk SSSR, Vol. 94, No. 3, 447-50 (1954). In Russian.  
Investigation of the spectrum and of the quantum efficiency of fluorescence of a rarefied vapour provides information on the process of conversion of energy by molecular absorption and an experimental examination of Vavilov's (J. Phys. USSR, Vol. 9, 68, 1945) law. It has been shown (Izv. Akad. Nauk SSSR, Ser. fiz., Vol. 15, 523, 1951) that many of the fluorescent properties of aromatic bonds are conditioned by intermolecular reactions and not by intramolecular interaction. The present results extend this concept. The absorption spectra and the fluorescent spectra are plotted for 3-aminophthalimide, 3,6-diaminophthalimide and 3,6-*tert*-amino-2-diaminophthalimide.

Title : Effect of foreign gases on the exhibition of fluorescence by vapors of aromatic compounds

Periodical : Dok. AN SSSR 99/5, 695-698, Dec 11, 1954

Abstract : Effect of foreign gases, such as H<sub>2</sub>, N<sub>2</sub>, NH<sub>3</sub> and C<sub>5</sub>H<sub>12</sub>, on the exhibition of fluorescence of vapors of aromatic compounds was studied. Substituted phthalimides were chosen for the aromatic compounds and the method of comparisons was used for determining the intensity of fluorescence. The relative fluorescence, i. e., a ratio of the intensity of fluorescence to the intensity of excited light, was also determined with the help of an electro-photo-spectrometer. Results are presented in the form of graph-diagrams. Six USSR references (1936-1954). Graphs.

Title : Spectra and Yield of Anti-Stokes and Stokes Fluorescence  
of Vapors of Aromatic Compounds

Orig Pub : Optika i spektroskopiya, 1956, Vol 1, No 2, 143-154

Abstract : The spectrum and the absolute value of the fluorescence quantum yield have been determined for vapors and solutions of the derivatives of phthalimide: 3-amino-, 3, 6-diamino-, 3,6-diaminohexamethylene-, 3-methylamino-, 3-acetamido-6-dimethylamino-, and 3-dimethylamino-6-amino as a function of the wavelength of the exciting light, the temperature, and the vapor pressure. In the case of vapors a decrease in quantum yield is observed for shifts both in the Stokes and in the anti-Stokes region. The first of these phenomena is explained by

the increase in the probability of a non-radiating transition as the magnitude of the exciting light quantum increases (Zh. fiz. khimii, 1947, Vol 21, 1111), while the second is a consequence of Vavilov's law on the necessary decrease of the quantum yield in the anti-Stokes region. Investigation of the duration of the luminescence and of the dependence of the quantum yield on the temperature has shown that anti-Stokes fluorescence is produced primarily by molecules rich in vibrational energy in the lowest electronic state; emission is primarily due to excited molecules which have small reserves of vibrational energy. It has been established that changes in the quantum yield are accompanied by certain changes in the fluorescence spectra. In some cases the fluorescence quantum yield of the vapor is higher than that of the corresponding solution.

Title : Effect of Extraneous Gases on Spectra and Fluorescence Yield of Vapors of Aromatic Compounds.

Orig Pub: Optika i spektroskopiya, 1956, 1, No 4, 536-545

Abstract: A study was made of the dependence of spectra of fluorescence yield of vapors of 3,6-tetramethyldiaminophthalimide, 3-dimethylamino-6-aminophthalimide, 3-aminophthalimide, and 3,6-diaminophthalimide on the pressure of extraneous gases at various temperatures. It is established that the effect of extraneous gases is not restricted to reinforcement of the fluorescence as a result of stabilization of the excited molecules, which takes place only upon excitation by large quanta. During excitation by small quanta one observes the reverse phenomenon, weakening of fluorescence.

Card : 1/2

USSR / Optics

K

Abs Jour: Referat Zhur-Fizika, 1957, No 4, 10403

It is shown that the excitation frequency, at which no changes occur in the fluorescence yield in the presence of extraneous gases (called the inversion frequency) coincides with the frequency of the electron transition. The observed phenomena of the reinforcement and weakening of the fluorescence are explained by the transfer of energy from the excited molecule to the molecule of the extraneous gas or vice versa. An estimate is made of the average amount of energy, transferred upon collision. Comparison of the values of the fluorescence yield of solutions and vapors shows that the action of the solvent on the fluorescing ability of the dissolved substance is not restricted to a rapid establishment of thermal equilibrium in the system, which is of universal character, but exerts also a specific influence.

A method is proposed for separate investigation of the specific and universal action of the solvent.

**Title:** Investigations by Belorussian Scientists in the Field of Spectroscopy and Ionization (Radio-Belorussian University for Spectroscopy i Lymanostenii)

**Abstract:** Vestnuk Akademii Nauk BSSR, 1959, Nr. 1, pp. 69-76 (USSR)

**Abstract:** These investigations are being carried out at the Institute of Physics and Mathematics (Institute of Mathematics and Mathematics) and the Physics Faculty of Belarusian State University (Belorussian University) under the direction of A. P. Prokof'ev, A. M. Stepanov, A. N. Sverdlov, N. A. Talyshovich, V. I. Polozov, Corresponding Member of Academy of Sciences, USSR, and P. I. Polozov, Corresponding Member of Academy of Sciences, USSR. In the field of theoretical spectroscopy, the investigations by P. I. Polozov, A. M. Stepanov, and A. N. Sverdlov are mentioned. Further, the following investigations are indicated:

A. P. Prokof'ev, B. I. Stepanov developed a theory of dispersion light filters.  
B. A. Borisovich, Ya. S. Kraschchikov, V. P. Lipshitsch obtained, by absorption, dispersion light filters for the infrared range.  
A. P. Prokof'ev analyzed the accuracy and the field of application of existing determination methods of optical constants of dispersed and non-dispersed materials.  
F. G. Scheremeteva, J. A. Leibius, V. G. Mikhalev obtained important results concerning the kinetics of one-stage spark discharge (spectral intensity and discharge temperature).  
I. A. Lutsenko, V. S. Mochalova examined the mutual influence of elements in spectrum analysis, and explained the methods for their classification.  
G. V. Gorobets suggested a series of methods to eliminate interferences of third elements.

G. V. Gorobets, J. A. Lutsenko succeeded in working out a general method of humic penicillin in ordinary penicillin. N. A. Borisovich, I. I. Borisovich, A. I. Struzen examined the infrared spectra of resins products. N. A. Borisovich, I. I. Zemanski examined the series of structural penicillins obtained by A. A. Borisovich worked out a luminescence method for the determination of the precipitating power of the seed of some kinds of beans.  
A. Ye. Prokof'ev obtained good results by the use of luminescence analysis in dermatology.

S. S. Kharmenko who examined the absorption spectra of the substances polycarboxylic complexes.  
B. A. Kartsev suggested spectral methods for analyzing aldehydes in the blood.  
N. M. Polyakova, N. I. Laskovo carried out an extensive spectroscopic-motational examination of the formation of molecular and complex compounds in solutions.  
N. D. Sverdlova spectroscopically examined the structure of various alkaloids.  
Yu. I. Stepanov, A. M. Frol' carried out theoretical investigations of the vibrational spectra of various silicate crystals.

TITLE:

Identification of Resin Acids by Means of Their Infrared Spectra

PERIODICAL:

Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,  
Vol 23, Nr 10, pp 1219-1221 (USSR)

ABSTRACT:

Coniferous resins, which essentially contain terpene hydrocarbons and resin acids, have many industrial uses. As the chemical analysis and the separation of the individual acids causes considerable difficulties in a mixture of pure resin acids, the infrared spectroscopic analysis of these substances is of particularly great importance. Hitherto, however, not many resin acids have been investigated in this way. In the present paper the authors give the results obtained by investigating four such resin acids, the structural formulas are mentioned: abietic acid (I), levopimamic acid (II), dextropimamic acid (III), and dehydroabietic acid (IV). Solutions of these acids in  $\text{CCl}_4$  as well as pressed samples of acid + potassium bromide were investigated by means of a IKS-11-type

Card 1/2

SOV/48-23-10-18/39

Identification of Resin Acids by Means of Their Infrared Spectra

spectrometer. The spectra of the solution and the pressed sample show practically no difference whatever. The spectra obtained are shown by four diagrams. Their particular features are discussed. Within the range of the valence oscillations of the groups CH,  $\text{CH}_2$ , and  $\text{CH}_3$  the spectra of I, II, and IV are very similar, and only III deviates, which is due to the existence of the group  $-\text{CH}=\text{CH}_2$ . The frequency of the bands corresponding to the groups C=O and COH ( $1685$  and  $1282 \text{ cm}^{-1}$ ) depends only to a small extent on the structure of the remaining acid molecule; the intensity of these bands, however, differs considerably according to the individual acids. Within the range of the double bond C=C a band was found at  $1544 \text{ cm}^{-1}$  in I, II, and IV, and one was found in III at  $1631 \text{ cm}^{-1}$  as well as one at  $1409 \text{ cm}^{-1}$ . In IV the band ( $1502 \text{ cm}^{-1}$ ), which is characteristic of the benzene ring, was found. A number of intense bands was also found in the range  $800$ - $1100 \text{ cm}^{-1}$ :  $893$  (I),  $1007$  and  $1024$  (II),  $821$  (IV) and  $905 \text{ cm}^{-1}$  (III). There are 1 figure and 1 Soviet reference.

PERIODICAL: Uspekhi fizicheskikh nauk, 1960, Vol. 71, No. 1, pp. 131-136

TEXT: This Conference was held at Minsk from October 19 to 24, 1959. It had been convened by the Nauchnyy sovet po lyuminestsensii AN SSSR (Scientific Council for Luminescence of the AS USSR) jointly with the Institut fiziki AN BSSR (Institute of Physics of the AS BSSR) and the Belorusskiy gosudarstvennyy universitet (Belorussian State University). The Conference was attended by 300 delegates, among them 200 from Moscow, Leningrad, Kiyev, Sverdlovsk, Yerevan, Tartu, Poltava, Saratov, Chita, and other centers of the Soviet Union. More than 100 lectures were delivered. Lecturers were A. N. Terenin and V. L. Yermolayev, Leningrad, (intramolecular energy transfer); V. L. Yermolayev, I. P. Kotlyar, and K. K. Svyatashev (internal conversion from the fluorescence singlet level on the phosphorescence triplet level in naphthalene derivatives); A. N. Terenin and A. V. Shabl' (discovery of phototransport of proton); L. G. ✓

TITLE: Fluorescence yield of complex molecules in vapor phaseSOURCE: Optika i spektroskopiya; sbornik statey. v. 1: Lyuminestsentsiya.  
Moscow. Izd-vo AN SSSR, 1963, 16-21

TOPIC TAGS: fluorescence, vapor, transition probability, activation energy

ABSTRACT: In the first part of the study the authors analyzed the temperature dependence of fluorescence yield of complex molecules in their vapor phase. Three arbitrary phthalamides and an aminoatroquinine are considered. Thermal quenching for fluorescence is shown to be weak for excitation in the second absorption band. Also, the rate of decrease in yield with temperature (in the same band) is found to be independent of the frequency of the excitation radiation. In the second part the activation energy is determined for radiationless transitions of the three complex molecules. For 3,6-tetramethyl diamino and 3-dimethylamino-6-aminophthalamide molecules the activation energies are shown

TITLE: Mean energy of excited vapor molecules and frequency of absorbed radiation

SOURCE: Optika i spektroskopiya; sbornik statey. v. 1: Lyuminesentsiya. Moscow, Izd-vo AN SSSR, 1963, 22-28

TOPIC TAGS: vapor, absorption, mean energy, transition, radiation

ABSTRACT: The relation between the mean energy of excited vapor molecules and the frequency of absorbed radiation has been obtained. This is given in equation (1):

$$\Delta E' = \bar{E}_1^* - \bar{E} - h\nu$$

where  $h$  = Planck's constant;  $\nu$  = frequency;  $\bar{E}$  = average energy of molecule in ground state;  $\bar{E}_1^*$  = mean energy of excited vapor molecule;  $\Delta E' = k^2/2\pi \ln x_\nu$ , with  $T$  = temperature,  $k$  = Boltzmann constant,  $x_\nu$  = absorption coefficient.  $\bar{E}_1^*$  is given by equation (2):

Card 1/2

L-18734-63  
ACCESSION NR: AT3002190

$$\overline{E_1} = \frac{\int (E + h\nu) \cdot B(E, \nu) \cdot p(E) \cdot dE}{\int B(E, \nu) \cdot p(E) \cdot dE} = \frac{E \cdot B(E, \nu)}{B(E, \nu)} + h\nu.$$

where  $B(E, \nu)$  = Einstein coefficient. Results are tabulated and plotted for three types of molecules: 3-aminophthalimide; 3,6-tetramethylaminophthalimide; and  $\beta$ -naphthalamine. Experimentally it is found that the effective excitation energy in the Stokes region changes linearly with frequency of excitation radiation and remains constant through transition into the anti-Stokes excitation. Orig. art. has: 15 formulas and 6 figures.

TITLE: On the quantum yield of fluorescence of vapor molecules

PERIODICAL: Doklady Akademii nauk BSSR, v. 7, no. 2, 1963, 87 - 91

TEXT: The quantum yield of fluorescence can be determined either by measuring under steady conditions the ratio of the number of quanta emitted in unit time to the number of those absorbed in the same time, or by finding the ratio of the number of quanta emitted after excitation has been stopped, to the total number of molecules in the excited state at the moment when excitation is discontinued. These two methods are shown to lead to inconsistent results with regard to the quantum yield of fluorescence of diluted vapors. In general, with diluted vapors,  $\gamma_1 \neq \gamma_2$ , and the yield  $\gamma_1$  experimentally found averaged with respect to the distribution  $\beta^*(E^*)$  should be comparable with the energy  $E^*$  averaged with respect to the same distribution. Only in the case of a relatively strict distribution function or when the probabilities  $f$  and  $d$  are independent of  $E^*$ , it may occur that  $\gamma_1 \approx \gamma_2$  and  $E_1^* \approx E_2^*$ . We obtain

On the quantum yield of...

$$\gamma_1 = \frac{\bar{E}_d^* - \bar{E}_1^*}{\bar{E}_d^* - \bar{E}_f^*} \quad (20)$$

which shows that the quantum yield of vapor fluorescence equals the ratio of the difference between the mean energies of the molecules leaving the excited state without emitting radiation ( $\bar{E}_d^*$ ) and of all molecules leaving the excited state ( $\bar{E}_1^*$ ) to the difference between the mean energies of the molecules leaving the excited state without emitting radiation and of those emitting fluorescence ( $\bar{E}_f^*$ ). Thus,  $\gamma_1 = 1$ , when  $\bar{E}_1^* = \bar{E}_f^*$ , and  $\gamma_1 = 0$ , when  $\bar{E}_1^* = \bar{E}_d^*$ . Since the fluorescence yield of vapors varies in the range  $0 \leq \gamma_1 \leq 1$ , either  $\bar{E}_d^* > \bar{E}_1^* > \bar{E}_f^*$  or  $\bar{E}_d^* \leq \bar{E}_1^* \leq \bar{E}_f^*$  holds. If a potential barrier exists for the radiationless transitions, the condition  $\bar{E}_d^* > \bar{E}_1^* \geq \bar{E}_f^*$  should be fulfilled.
